**A County-Level Measure of Urban Influence.** By Linda M. Ghelfi and Timothy S. Parker.
Rural Economy Division, Economic Research Service, U.S. Department of Agriculture. Staff
Paper No. 9702.

Abstract

This report provides a classification of counties and independent cities by level of urban influence in 1990. Urban influence is measured by the size of metro areas, the adjacency of nonmetro counties to each size of metro area, and the size of the largest city within each nonmetro county. This classification may be a valuable tool for researchers interested in the effects of population concentration on county economies.

Acknowledgments

Thanks to Jacqueline Salsgiver for her classification of metro areas by size in 1980 which was the initial basis for our metro area size classification; to Kenneth Deavers, David McGranahan, Calvin Beale, John Cromartie, and Michael Lahr who advised us on the earlier 1980 urban influence codes; and to the numerous people who gave us constructive criticism on the earlier codes so that we could make these 1990 codes of greater value to the research community.

This report was reproduced for limited distribution to the research community outside the U.S. Department of Agriculture and does not represent an official position of the Department.

A County-Level Measure of Urban Influence

Linda M. Ghelfi and Timothy S. Parker

An area's geographic context has a significant effect on its development. Economic opportunities accrue to a place by virtue of both its size and its access to larger economies. And, access to larger economies—centers of information, communication, trade, and finance—enables a smaller economy to connect to national and international marketplaces. These relationships among economies are basic concepts of the central place theory commonly studied in regional economics (Lösch, 1954; Nourse, 1968). Population size, urbanization, or access to larger communities are often crucial elements in research dependent on county-level data sets. To further such research, we have developed a set of county-level urban influence categories that captures some differences in economic opportunities.

The Urban Influence Codes

The urban influence codes divide the 3,141 counties, county equivalents, and independent cities in the United States into 9 groups.¹ Metro counties are divided into two groups by the size of the metro area—those in “large” areas with at least 1 million residents and those in “small” areas with fewer than 1 million residents. Nonmetro counties are divided into groups by their adjacency to metro areas—adjacent to a large metro area, adjacent to a small metro area, and not adjacent to a metro area. Nonmetro counties **adjacent** to either size metro area are further classified by the size of their “own city”—those containing all or part of a city of 10,000 or more residents and those containing no part of a city that large.² Nonmetro counties **not adjacent** to a metro area are divided by the size of the largest place they contain—those containing all or part of their “own city” of 10,000 or more residents, containing all or part of a “town” of 2,500-9,999 residents, and containing no part of a town with at least 2,500 residents (putting the entire county in the Census Bureau’s definition of “rural”). Census-defined places are considered to be cities or towns in this classification, Virginia’s independent cities are considered in determining the largest city or town in the counties which the independent cities border, Hawaii’s Kalawao County is considered to have the size of place that island-sharing Maui County, HI, has, and Montana’s Yellowstone National Park is considered to have the size of place that adjoining Park County has.

Urban influence codes group metro and nonmetro counties according to the official metro status announced by the Office of Management and Budget in June 1993, based on

¹For simplicity, the term county is used from now on to refer to all 3,141 counties, parishes, boroughs, census defined areas, independent cities, and Yellowstone National Park reported in the 1990 Census of Population and Housing data files.

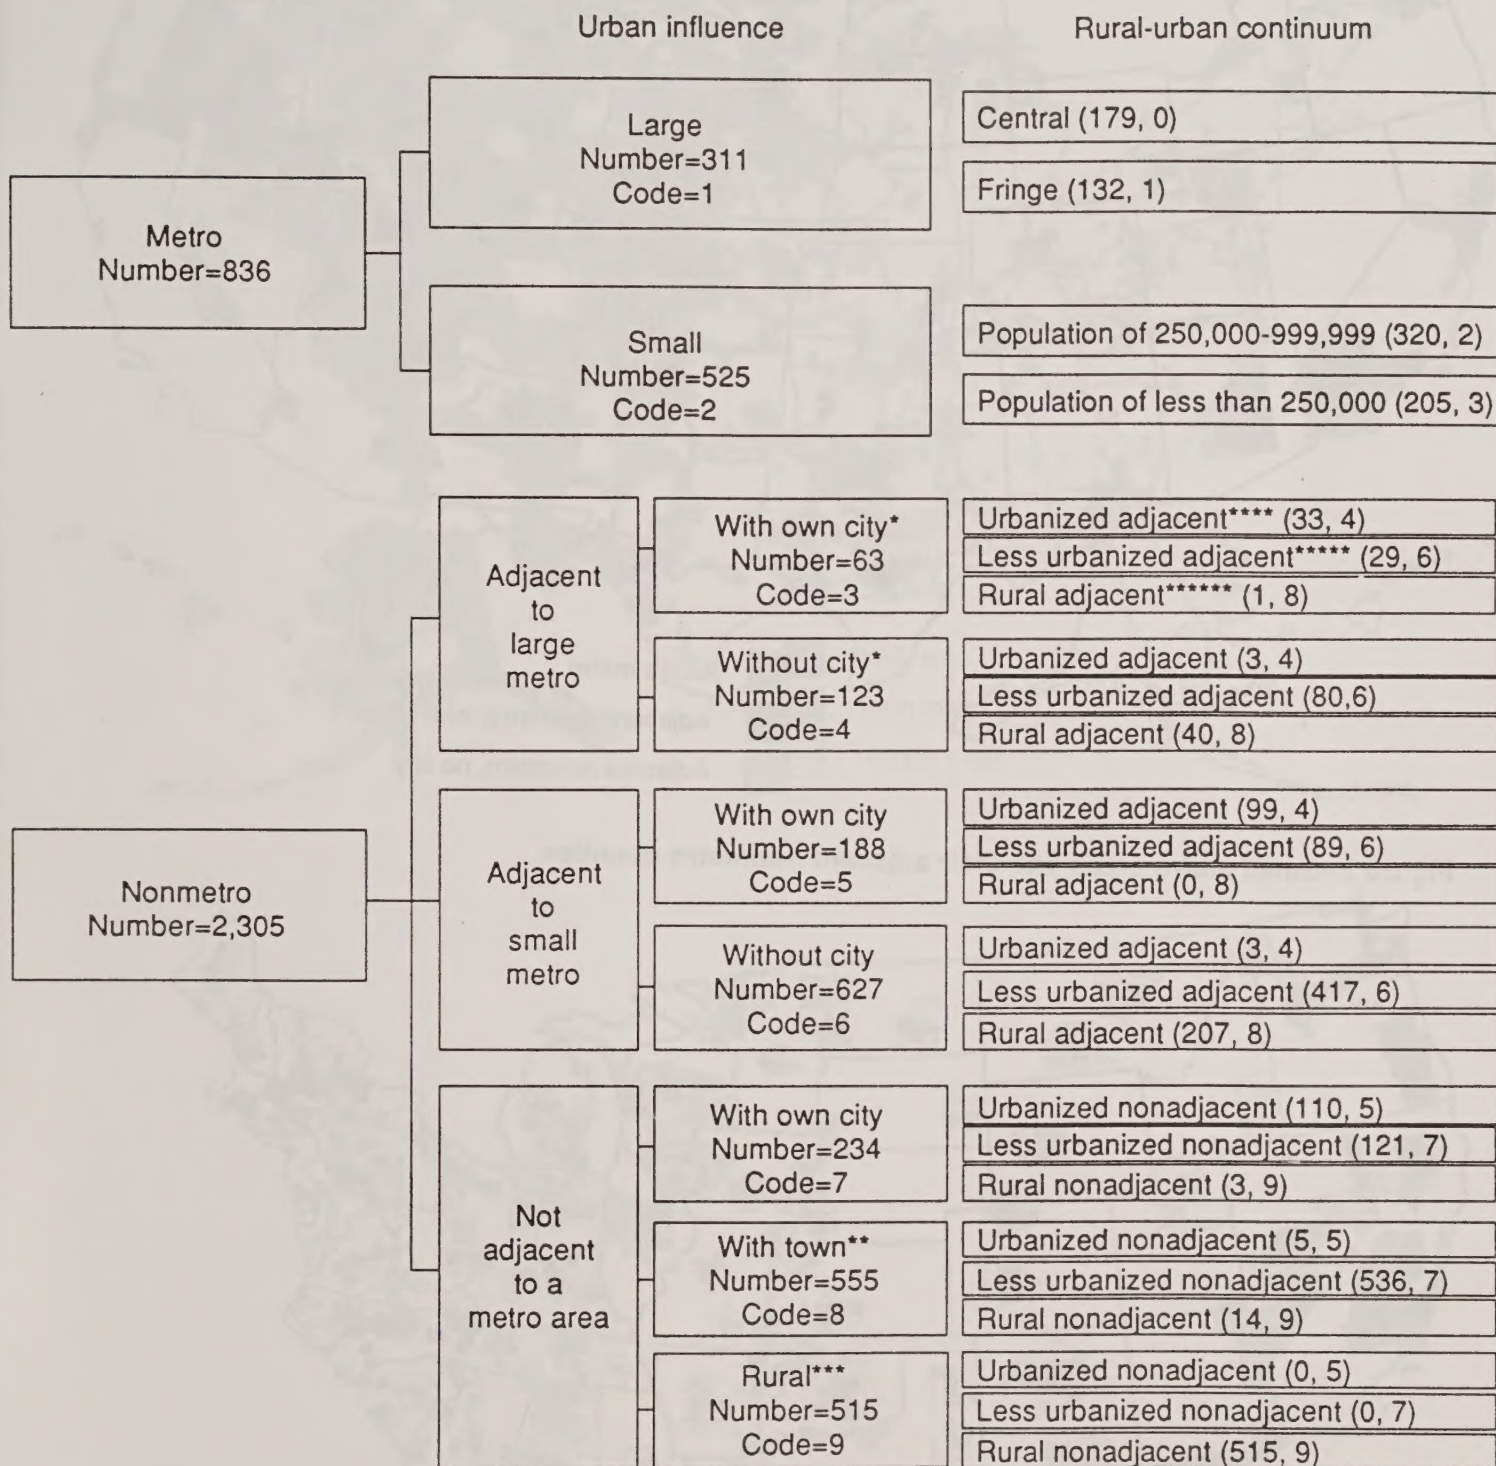

²In creating the earlier, 1980, version of the urban influence codes, we tested higher cutoff points of 15,000 or more and of 20,000 or more residents, but too few nonmetro cities were that large.

population and commuting data from the 1990 Census of Population.³ Nonmetro counties are defined as adjacent if they abut a metro area and have at least 2 percent of employed persons commuting to work in core county(ies) of the metro area. When a nonmetro county met the adjacency criteria to more than one metro area, it was designated as adjacent to the metro area to which the largest percentage of its workers commuted.

There are 836 metro counties, of which 311 are part of large metro areas and 525 are part of small metro areas (fig. 1). There are 2,305 nonmetro counties. Of the 186 nonmetro counties that are adjacent to large metro areas, 63 have their own city. Another 815 nonmetro counties are adjacent to small metro areas, 188 of which have their own city. Among the 1,304 nonmetro counties that are not adjacent to a metro area, 234 have their own city, 555 have a town, and 515 are rural. Not all the metro areas are completely surrounded by adjacent counties (figs. 2 and 3). Some counties abutting metro areas do not meet the 2-percent commuting requirement to be considered "adjacent." Others have more commuting to a metro area of the other size, and so are classified as adjacent to the other area. Some of the urban influence groups are concentrated in particular census divisions. Most concentrated are the rural nonadjacent counties—41 percent of them are in the West North Central division (fig. 4, table 1).

³A Metropolitan Statistical Area (MSA) is a county or group of counties containing at least 1 city of 50,000 or more residents or containing a Census Bureau-defined urbanized area of at least 50,000 residents with a total metro area population of at least 100,000. In addition to the county or counties containing the main city or urbanized area, an MSA may include other counties having strong ties to the central city. For a more thorough definition of metropolitan, see U.S. Department of Commerce, Bureau of the Census, *State and Metropolitan Area Data Book, 1991*.

Figure 1--Counties by urban influence and rural-urban continuum codes

Note: Numbers in parentheses after the rural-urban continuum names are the number of counties and the rural-urban continuum code.

*With own city means the county contains all or part of a city with at least 10,000 residents; without city means the county contains no part of a city that large.

**With town means the county contains all or part of a city with 2,500-9,999 residents.

***Rural means the county contains no part of a city with at least 2,500 residents.

****Urbanized means the county contains at least 20,000 urban residents.

*****Less urbanized means the county contains 2,500-19,999 urban residents.

*****Rural in this classification means the county contains less than 2,500 urban residents.

¹NE=New England, including Connecticut, Maine, Massachusetts, New Hampshire, Rhode Island, and Vermont.

MA=Middle Atlantic, including New Jersey, New York, and Pennsylvania.

ENC=East North Central, including Illinois, Indiana, Michigan, Ohio, and Wisconsin.

WNC=West North Central, including Iowa, Kansas, Minnesota, Missouri, Nebraska, North Dakota, and South Dakota.

SA=South Atlantic, including Delaware, District of Columbia, Florida, Georgia, Maryland, North Carolina, South Carolina, Virginia, and West Virginia.

ESC=East South Central, including Alabama, Kentucky, Mississippi, and Tennessee.

WSC=West South Central, including Arkansas, Louisiana, Oklahoma, and Texas.

M=Mountain, including Arizona, Colorado, Idaho, Montana, Nevada, New Mexico, Utah, and Wyoming.

P=Pacific, including Alaska, California, Hawaii, Oregon, and Washington.

²Bold numbers in this panel denote that the share of counties in the urban influence group is as high or higher than the share of all counties in the census division.

Relationship to the Rural-Urban Continuum Codes

Because many researchers are familiar with and use the ERS rural-urban continuum codes ("Beale" codes), we show in figure 1 how our codes and the continuum codes relate to each other. While we break metro areas only into large and small, the continuum codes differentiate central and fringe counties within the large category and two sizes of metro areas within the small category. The definition of a core county of a large metro area is no longer restricted to counties containing all or part of the central city, so we decided not to differentiate between the two types of large metro counties. We had planned to break our small metro category into the two size classes used in the continuum codes, but in analyzing population and employment growth in nonmetro counties adjacent to the two sizes of smaller metro areas, we found little difference between the effects the two sizes of metro areas had on surrounding counties. Therefore, we chose not to differentiate between them.

It is in the groupings of nonmetro counties that the two classifications differ substantially. As expected, the "urbanized" continuum counties mostly fall into our "own city" categories, only 12 do not contain any part of a city of 10,000 or more residents. However, many of the "less urbanized" continuum counties have their "own city." And four of the "rural" continuum counties contain part of a city of 10,000 or more residents.⁴

An Example of How Urban Influence Groups Differ

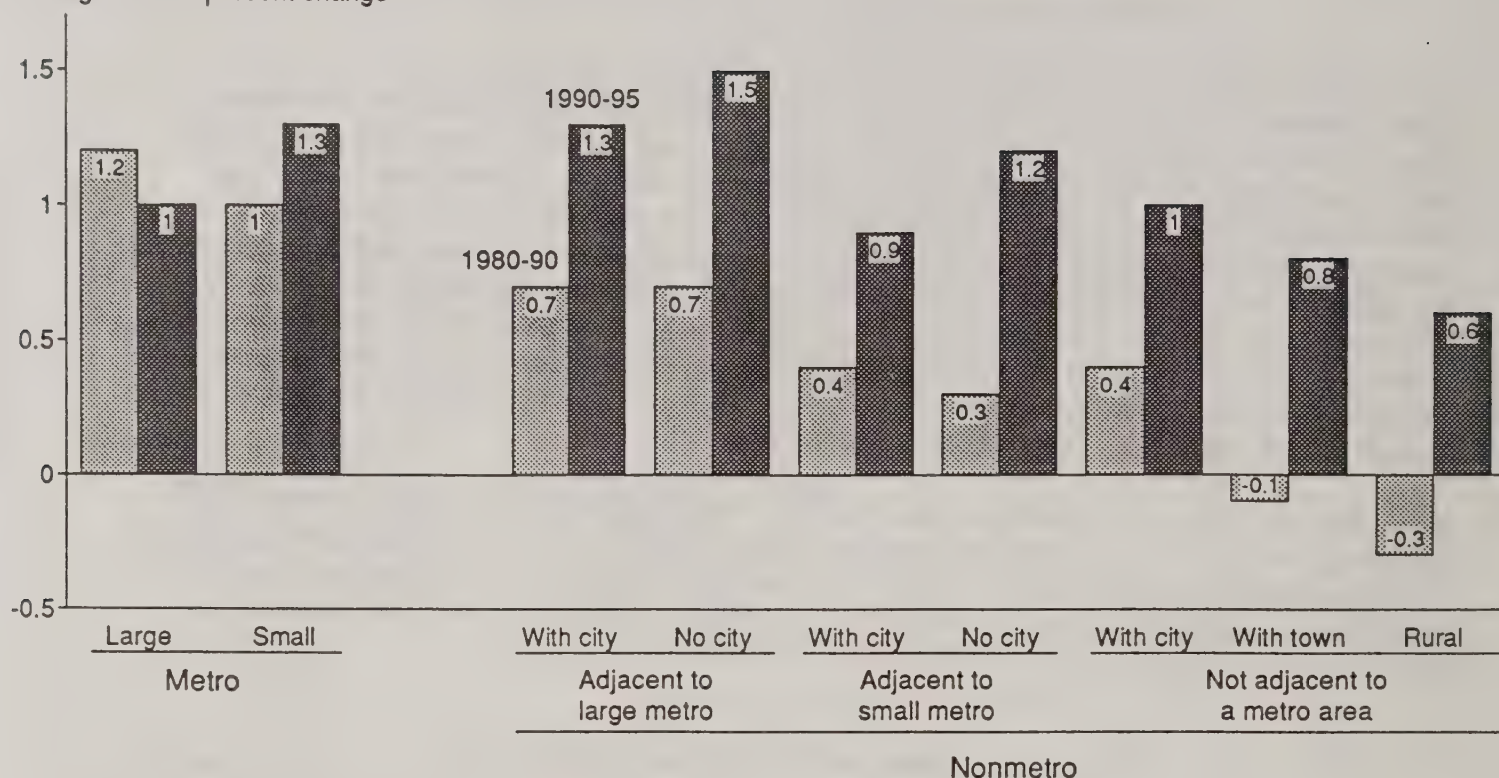

Population change during the 1980's and early 1990's shows a changing way in which the urban influence groups differ from each other. The population of large metro areas grew at an annual rate of 1.2 percent from 1980 to 1990 (fig. 5). Nonmetro counties adjacent to large metro areas averaged annual population growth of 0.7 percent whether they had their own cities or not. Nonmetro counties adjacent to the smaller metro areas did not receive the same boost from their location. While the small metro areas grew almost as fast as the large metro areas, the nonmetro counties adjacent to the small metro areas grew less than half as fast as they did. At the nonadjacent end of the nonmetro spectrum, counties with their own cities experienced moderate population growth. Those with towns averaged slight annual losses, and the rural counties averaged 0.3 percent annual population loss.

Federal-State estimates of county population since the 1990 Census show population growth favoring nonmetro areas in the early 1990's. Nonmetro counties adjacent to large metro areas had faster population growth during 1990-95 than did the large metro areas themselves. Small metro areas are now growing faster than the large metro areas and their adjacent nonmetro counties are growing nearly as fast. And, countering their decline during the 1980's, the nonadjacent counties with towns and the totally rural counties experienced population growth during 1990-95.

⁴Camden, NC, adjacent to the large metro area of Norfolk-Virginia Beach-Newport News, VA, contains 29 residents of Elizabeth City, a nonmetro city of over 14,000 located mostly in Pasquotank County, NC. The 3 rural continuum counties that we classify as "nonadjacent with city" are Montgomery County, GA (contains 111 residents of Vidalia, a city of 11,000 mostly in Toombs County, GA), Leelanau County, MI (contains 29 residents of Traverse City, a city of 15,000 mostly in Grand Traverse County, MI), and Ralls County, MO (contains 269 residents of Hannibal, a city of nearly 18,000 mostly in Marion County, MO).

Figure 5--Population change, 1980-95

Average annual percent change

Source: Calculated by ERS using data from the Bureau of the Census.

In the 1980-90 period, the population of adjacent nonmetro counties with cities grew at about the same rate as those without cities. It was in the nonadjacent group that having a city appeared to boost population growth. During 1990-95, the population of adjacent counties without cities has grown faster than that of the adjacent counties with cities. These nonmetro areas appear to be benefiting more now than during the 1980's from their proximity to metro areas. However, they may also be juggling the needs of metro migrants seeking less dense, less expensive housing with the desires of long-term residents to maintain the "rural" quality of life.

In the Special Census Issue of *Rural Conditions and Trends* (Ghelfi, 1993), a broad set of social and economic characteristics were analyzed with an earlier, 1980, version of the urban influence codes that did not differentiate the adjacent counties by whether or not they had their own cities and did not distinguish totally rural nonadjacent counties from those containing towns. Counties grouped by that less detailed measure of urban influence differed in population, labor force, income, poverty, and housing characteristics, with adjacent counties and nonadjacent counties with cities generally outperforming the nonadjacent counties without cities.

Conclusions

The urban influence codes measure the importance of adjacency to large and small metro areas and the importance of the size of the largest city within a nonmetro county, concepts that are not directly measured in other widely used typologies. However, the coding structure (from 1 to 9) should not be viewed as reflecting a continuous decline in urban influence. The codes are shown in the appendix and will soon be available through the Internet. [Contact Tim Parker at 202-219-0451 (or by e-mail--tparker@econ.ag.gov) for instructions on when and how to download the file.] We would appreciate receiving copies of analyses done with the codes and comments on the classification. We are looking into early 1990's trends in a range of socioeconomic characteristics to see if the population growth pattern is indicative of other changes. That analysis should be published within the year.
